Public release date: Jan 01, 1966

**DISCLAIMER**
By accessing and using the Alberta Energy website to download or otherwise obtain a scanned mineral assessment report, you (“User”) agree to be bound by the following terms and conditions:

a) Each scanned mineral assessment report that is downloaded or otherwise obtained from Alberta Energy is provided “AS IS”, with no warranties or representations of any kind whatsoever from Her Majesty the Queen in Right of Alberta, as represented by the Minister of Energy (“Minister”), expressed or implied, including, but not limited to, no warranties or other representations from the Minister, regarding the content, accuracy, reliability, use or results from the use of or the integrity, completeness, quality or legibility of each such scanned mineral assessment report;

b) To the fullest extent permitted by applicable laws, the Minister hereby expressly disclaims, and is released from, liability and responsibility for all warranties and conditions, expressed or implied, in relation to each scanned mineral assessment report shown or displayed on the Alberta Energy website including but not limited to warranties as to the satisfactory quality of or the fitness of the scanned mineral assessment report for a particular purpose and warranties as to the non-infringement or other non-violation of the proprietary rights held by any third party in respect of the scanned mineral assessment report;

c) To the fullest extent permitted by applicable law, the Minister, and the Minister’s employees and agents, exclude and disclaim liability to the User for losses and damages of whatsoever nature and howsoever arising including, without limitation, any direct, indirect, special, consequential, punitive or incidental damages, loss of use, loss of data, loss caused by a virus, loss of income or profit, claims of third parties, even if Alberta Energy have been advised of the possibility of such damages or losses, arising out of or in connection with the use of the Alberta Energy website, including the accessing or downloading of the scanned mineral assessment report and the use for any purpose of the scanned mineral assessment report so downloaded or retrieved.

d) User agrees to indemnify and hold harmless the Minister, and the Minister’s employees and agents against and from any and all third party claims, losses, liabilities, demands, actions or proceedings related to the downloading, distribution, transmissions, storage, redistribution, reproduction or exploitation of each scanned mineral assessment report obtained by the User from Alberta Energy.

History

Petroleum and Natural Gas Reservation 3865 was acquired at the Director of Mineral Rights Sale dated May 12, 1960 and became effective May 13, 1960. The Reservation contained 61,440 acres. The reservation is located in Townships 121 and 122 and Ranges 21 and 22 west of the Fifth Meridian.

Geological Evaluation

Figure 1 shows the areal extent of P & NG Reservation 3865 and Figure 2 the terminology used to describe the rock units underlying it.

Shell Steen River 14-29 represents the normal section of Palaeozoic fill within the Reservation and IOE Steen River 12-19, the abnormal section. Both wells have been used in compiling the stratigraphic section in Figure 2.

Access is gained by bush roads off the Mackenzie Highway, which lies only 6 miles southeast of the southeast corner of the reservation.

The Reservation covers swampy terrain of low relief which drains the Cameron Hills to the northwest into the Steen River to the southeast.

The total post Precambrian sedimentary fill in the report area is approximately 4600' (Figure 3). The sediments and intrusives
range in age from early Middle Devonian to Quaternary.

Eroded Mesozoic rocks comprise some 370' of this total and consist mainly of marine Lower Cretaceous, grey to dark grey pyritic bentonitic shales. A 25' basal Cretaceous sandstone is the only coarse detritus of the Mesozoic section here.

In part of the Reservation, the Devonian section is eroded to the Winterburn limestones leaving only 170' of Winterburn. This section subcrops unconformably against the overlying Cretaceous beds. In the remainder of the Reservation, a volcanic and intrusive series subcrops unconformably against the normal Cretaceous. This series was penetrated in the IOE Steen River 12-19 borehole. The Devonian structure (Figure 4) shows regional flattening due to the erosion of the Upper Palaeozoic to the Winterburn, superimposed on the effect of local warping of rocks adjacent to the Steen River igneous and volcanic series.

The Devonian rocks offer the best prospect in the area. These sediments comprise some 3800' of the total sedimentary fill and thicken away from the Steen River series to the northeast and southwest (Figure 5). These sediments vary in age from the Upper Devonian Winterburn limestones to Middle Devonian red clastics of the Elk Point Group.

The best prospects in the area appear to be the limestones of the Slave Point formation, the crystalline dolomites of the Sulphur Point, dolomite of the Keg River and the basal Palaeozoic sand unit. Shell Steen River 14-29 tested a gas flow from the Slave Point top of 60 Mcf/day with a recovery of 90' of mud, while at Delcalta Lutose Creek 8-19, 740' of gassy oil cut salt water was recovered from the Sulphur Point dolomite. The Sun
Russet Creek 6-11 well yielded 510' of salt water from this formation.
Neither the Keg River nor the Basal Palaeozoic Sand, although prospective, have been tested on the Steen structure to date.

Figure 6 shows the very uniform character of the sedimentary fill to the end of Elk Point time. A 'nose' effect or thickening in the Elk Point to Precambrian isopach (Figure 6) on the east flank of the present Steen River structure suggests the possibility of structure in this locale even as early as Precambrian time. However, the paleotopography must have been much subdued to permit the widespread and relatively uniform shallow seas to deposit the predominantly evaporitic sequence found here.

Figure 7 shows the present Precambrian structure. Its regional strike is to the northwest and southeast, and in the Reservation area, regional dips are to the northeast and southwest off the Steen River structure. The basal Palaeozoic sand which is well developed at Shell Steen River 14-29 is also prospective.

Figure 8 indicates our seismic coverage on Reservation 3865. Every effort was made to obtain a reasonable interpretation from this coverage. However, upon obtaining the results of our two wells, our interpretative reflections were found to be noise which was thought to be caused by some type of intrusion in the area.
APPENDIX I

Final Report on Iron Prospecting Permit No. 28

History

Iron Prospecting Permit No. 28 was filed on by Imperial Oil Enterprises Ltd. on June 26, 1963, and became operative on June 27, 1963. The Permit contained 87,781 acres in Townships 120 through 122 in Ranges 21 and 22 West of the Fifth Meridian.

Geological Evaluation

This Permit outlined on overlay #1 to Figure #1 was acquired prior to drilling the IOE Steen 12-19 (12-19-121-21-W5) in the event that mineralized basement rocks might be encountered. Subsequent drilling of the above mentioned well revealed a very shallow occurrence of basement rocks with no visible mineralization in cores or samples. Electrical logs also failed to indicate any mineralization in the borehole.

July 8, 1964

J. C. Underhill
Acting Division Exploration Mgr.
Comments on IOE Sheet 12-19 538: Grey Shale

1. This sample is definitely from Palaeozoic. The microfloral assemblage is not very rich or well preserved. However, following wider species are definitely present:

   (1). Archaeogordiella micracumulata var. farnensis Naukeva — Farnesium of USSR
   — V. Devonian of Parry Islands — (Abundant)

   (2). Acanthoioleia farnensis Naukeva — Farnesium of USSR; V. Devonian of Parry Islands — (Common)

   (3). A piece of Archaeaalatea sp. cf. A. conspicua Naukeva — M. Frasnian USSR (Rare)

(4). Hypsornatoilea erinacea Naukeva — N. Frasnian (Rare)

(5). Reticaloiolea semigonalis McGregor — Ghost River Fm., Alberta; M. - N. Devonian

   Besides these forms like Microrticulatosporites sp., Endosporites sp., Lycospora sp.,
   Reticaloiolea sp., Calamospora sp., Cristatoiolela sp., etc., which make their entrance in
   Devonian are present.

   Among the microplankton, Vignachnia reductionis and Microhystrichium sp. are present,
   indicating a brackish, nearshore environment. P.T.O.

On the basis of this assemblage following conclusions can be drawn:

1. The sample is probably U. Devonian in age.
2. The depositional environment was brackish, nearshore.

**Notes**

- **Recent gravels, mud.**
- **Shale, grey to dark grey pyritic in part.**
- **Shale, dark grey to light grey brown and minor quartz, glauconitic sandstone.**
- **Limestone, grey brown to tan, silty, fragmental argillaceous with shale, green, flaky interbeds.**
- **Shale, grey green, silty in part with minor interbedded shaly limestone stringers.**
- **Finely crystalline limestone.**
- **Green shale.**
- **Dolomite, buff, very fine to medium crystalline.**
- **Interbedded anhydrite and finely crystalline dol., minor salt.**
- **Limestone, cryptocrystalline.**
- **Brown dolomite anhydrite.**
- **Red shales and sandstones.**
