Received date: Dec 31, 1968

Public release date: Jan 01, 1970

## **DISCLAIMER**

By accessing and using the Alberta Energy website to download or otherwise obtain a scanned mineral assessment report, you ("User") agree to be bound by the following terms and conditions:

- a) Each scanned mineral assessment report that is downloaded or otherwise obtained from Alberta Energy is provided "AS IS", with no warranties or representations of any kind whatsoever from Her Majesty the Queen in Right of Alberta, as represented by the Minister of Energy ("Minister"), expressed or implied, including, but not limited to, no warranties or other representations from the Minister, regarding the content, accuracy, reliability, use or results from the use of or the integrity, completeness, quality or legibility of each such scanned mineral assessment report;
- b) To the fullest extent permitted by applicable laws, the Minister hereby expressly disclaims, and is released from, liability and responsibility for all warranties and conditions, expressed or implied, in relation to each scanned mineral assessment report shown or displayed on the Alberta Energy website including but not limited to warranties as to the satisfactory quality of or the fitness of the scanned mineral assessment report for a particular purpose and warranties as to the non-infringement or other non-violation of the proprietary rights held by any third party in respect of the scanned mineral assessment report;
- c) To the fullest extent permitted by applicable law, the Minister, and the Minister's employees and agents, exclude and disclaim liability to the User for losses and damages of whatsoever nature and howsoever arising including, without limitation, any direct, indirect, special, consequential, punitive or incidental damages, loss of use, loss of data, loss caused by a virus, loss of income or profit, claims of third parties, even if Alberta Energy have been advised of the possibility of such damages or losses, arising out of or in connection with the use of the Alberta Energy website, including the accessing or downloading of the scanned mineral assessment report and the use for any purpose of the scanned mineral assessment report so downloaded or retrieved.
- d) User agrees to indemnify and hold harmless the Minister, and the Minister's employees and agents against and from any and all third party claims, losses, liabilities, demands, actions or proceedings related to the downloading, distribution, transmissions, storage, redistribution, reproduction or exploitation of each scanned mineral assessment report obtained by the User from Alberta Energy.

REPORT ON FIELD EXAMINATION

SULPHUR PROSPECTING PERMIT NO. 168

REDCLAY CREEK AREA, ALBERTA

The field work on these permits has been carried out at the request of Mr. Marvin Morris, acting for Quintana Petroleum Corporation. The work was authorized under our letter agreement of September 24, 1968, and the request made was that J. C. Sproule and Associates Ltd. should investigate and sample representative locations from selected areas. This work was described as Step 1 of Phase II in the program proposed in our letter of September 24. We quote as follows with reference to our proposal for field examination:

"The field party conducting Phase II would, upon arrival in the field, immediately check those points of indicated interest that have become evident from the photogeological study. More specifically, we think that the preliminary study has pointed out those areas that are likely to contain sulphur. All areas where sulphur is likely to occur will be checked by the helicopter reconnaissance crew. Hand specimens and/or auger samples will be taken to determine the presence or absence of sulphur. We might call this preliminary part of the field program Step 1 of Phase II. The total cost of Step 1 would be \$750 per permit-unit, or \$2,250 for Permit No. 168, which totals approximately 60,000 acres."

The field work was conducted in September, 1968, by Mr. S. R. L. Harding and Mr. N. Soul, from a base field camp on the east side of the Athabasca River about six miles upstream from the mouth of the Firebag River. Use was made of a Bell G2 helicopter, contracted from Okanagan Helicopters Ltd., and a river boat with outboard motor. Fuel was placed in the area by barge.

The sample locations are shown on the accompanying Figure 1 and the related analyses by Chemical and Geological Laboratories Ltd. are presented as Appendix I. Field notes relating to the samples taken have been placed beside the analyses in the Appendix.

All areas indicated by the photogeological study to be prospective were examined in the field and representative samples taken. These areas yielded only traces of sulphur, except for Sample Location 168-8A, a small muskeg, at the south side of Area No. 4, from which a sample analyzed 3.51 percent sulphur, and even this is not a significantly high value. The material included muskeg debris, clay, and alluvium. These are normally rather high in sulphur in lake or depressional areas where sulphur is known. That being the case, it is reasonably certain that areas on the west side of the Athabasca River marked by the photogeological study do not contain occurrences of native sulphur in sufficient quantities to justify further exploratory activity. On the other hand, certain evidence observed on the east side of the Athabasca River may justify considering further exploration for that area.

Two sulphur springs were observed within Permit No. 168, in the Coffey Lake area, east of the Athabasca River, and additional sulphur springs were observed within one-quarter mile east of the Permit (Figure 1 and Plate I). These springs almost certainly emerge from Devonian carbonate rocks. Sample No. 168-7 from a sulphur spring yielded 18.23 percent sulphur on analysis. One auger hole in a swampy meadow yielded only traces of sulphur (Samples 168-1A and 1B). The whole Coffey Lake area between the escarpment to the southeast and the Athabasca River to the west is, however, quite low and generally poorly drained and sulphur accumulations could occur in this area.

It is recommended that the portion of Sulphur Prospecting Permit No. 168 indicated on Figure 1 and which includes the following sections totalling approximately 5,760 acres should be retained for further investigation:

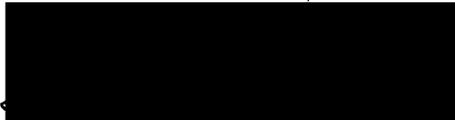

Sections 28, 29, 32 and 33, Township 99, Range 9, W. 4 M.  
Sections 3, 4, 9, 10 and 15, Township 100, Range 9, W. 4 M.

It is recommended that those portions of Sulphur Prospecting Permit No. 168 not listed in the preceding paragraph be abandoned by the Company and a request made for the return of any deposits for which the Company may be eligible.

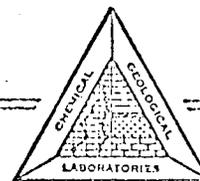

We will be pleased to submit an estimate of the cost of conducting an adequate exploration sampling program over the areas recommended for retention at such time as a complete analysis of costs and performance of the past season's operations have been completed.

This report has been prepared for the exclusive use of Quintana Petroleum Corporation and is not to be reproduced in whole or in part in any form without the written permission of J. C. Sproule and Associates Ltd.

SAMPLE NUMBER	ELEMENTAL SULPHUR (% by Weight on Dry Sample)	FIELD NOTES (By S. R. L. Harding)
168-1	Trace	Soil sample from spruce forest.
168-1A	Trace	Muskeg sample at 4 feet.
168-1B	Trace	Muskeg sample at 8 feet.
168-2	Trace	Soil sample from fir forest.
168-3	Trace	Soil sample on river bank.
168-4	Trace	Soil sample from swamp.
168-5	Trace	Mud near small creek mouth.
168-6-1	Trace	Glacial clay.
168-6-2	Trace	Deposit from seepage above clay.
168-7	→ 18.23	Deposit at outlet of sulphur spring.
168-8A	3.51	Sample from grassy muskeg, depth 3 feet.
168-9A	Trace	Sample from grassy muskeg, depth 2½ feet
168-10	Trace	Sample from grassy muskeg, depth 2 feet.
168-11	Trace	Sample from grassy muskeg, depth 3 feet.
168-12	Trace	Sample from old lake bed, depth 2 feet.
168-13	Trace	Soil sample from grassy meadow.
