DISCLAIMER

By accessing and using the Alberta Energy website to download or otherwise obtain a scanned mineral assessment report, you ("User") agree to be bound by the following terms and conditions:

- a) Each scanned mineral assessment report that is downloaded or otherwise obtained from Alberta Energy is provided "AS IS", with no warranties or representations of any kind whatsoever from Her Majesty the Queen in Right of Alberta, as represented by the Minister of Energy ("Minister"), expressed or implied, including, but not limited to, no warranties or other representations from the Minister, regarding the content, accuracy, reliability, use or results from the use of or the integrity, completeness, quality or legibility of each such scanned mineral assessment report;
- b) To the fullest extent permitted by applicable laws, the Minister hereby expressly disclaims, and is released from, liability and responsibility for all warranties and conditions, expressed or implied, in relation to each scanned mineral assessment report shown or displayed on the Alberta Energy website including but not limited to warranties as to the satisfactory quality of or the fitness of the scanned mineral assessment report for a particular purpose and warranties as to the non-infringement or other non-violation of the proprietary rights held by any third party in respect of the scanned mineral assessment report;
- c) To the fullest extent permitted by applicable law, the Minister, and the Minister's employees and agents, exclude and disclaim liability to the User for losses and damages of whatsoever nature and howsoever arising including, without limitation, any direct, indirect, special, consequential, punitive or incidental damages, loss of use, loss of data, loss caused by a virus, loss of income or profit, claims of third parties, even if Alberta Energy have been advised of the possibility of such damages or losses, arising out of or in connection with the use of the Alberta Energy website, including the accessing or downloading of the scanned mineral assessment report and the use for any purpose of the scanned mineral assessment report so downloaded or retrieved.
- d) User agrees to indemnify and hold harmless the Minister, and the Minister's employees and agents against and from any and all third party claims, losses, liabilities, demands, actions or proceedings related to the downloading, distribution, transmissions, storage, redistribution, reproduction or exploitation of each scanned mineral assessment report obtained by the User from Alberta Energy.

DESCRIPTION OF PROPERTY

Quartz Mineral Exploration Permit #145

Township 121, Range 5, West of 4M
Sections 20, 21, 28 to 33 inclusive

Township 122, Range 5, West of 4M
Sections 6, W 1/2 of 5

Township 121, Range 6, West of 4M
Sections 25, 26, 35 and 36.

Township 122, Range 6, West of 4M
Sections 1 and 2

Containing 9,920 acres.

INTRODUCTION

This report has been prepared at the request of the Department of Mines and Minerals, Government of Alberta, Edmonton, Alberta in compliance with the existing regulations governing Quartz Mineral Exploration permits within the Province.

The object of this study is to ascertain the economic potential of possible mineral deposits within the acquired permit area. The report presents the results of an investigation and examination in the field where samples were taken and subsequently assayed with an emission control spectrograph.

LOCATION, TOPOGRAPHY AND ACCESS

Direct access to this region is gained to Fort Chipewyan by air from Edmonton and a float equipped Cessna 185 to Hooker Lake. The permit lies approximately twenty-two miles east of Hay Camp on the navigatable Slave River. Travel within the area itself is very difficult and can only be economically accomplished by means of float or ski equipped fixed wing aircraft or helicopter.

The topography of the Precambrian Shield east of the Slave River is generally a gentle undulating surface of low rounded hills of granite, however, deep valleys and fault scarps up to 250' high are

encountered. The area is mainly Precambrian out crop with numerous glacially-scoured lakes and muskeg areas. Local relief up to 400' is probably maximum in the area of Hooker Lake.

The valleys are wooded with spruce, fir and poplar. Scrubby muskeg and open watery muskegs are confined to the low areas.

THE WORK

A three man prospecting crew landed on Hooker Lake in June, 1970 for the main purpose of obtaining interesting samples on the minor faults in the permit area. Travel or walking was severely curtailed due to the dead fall and water laden muskeg in the low areas. However, a total of sixty-three samples were extracted from the faults in the permit area revealing the conclusion that the area was well covered by the prospecting crew.

GENERAL GEOLOGY

A large concentration of vein and related types of mineralization are known to occur along the Slave River and exceeding 40 miles in width to the east, northward of Fort Chipewyan. Metalliferous vein deposits are generally recognized to be genetically and spatially related to faulting. Therefore, structural control can be used to delineate the

most promising prospecting areas as well as eliminating much of the unfavourable locations.

The rocks within the permit area are of Precambrian age. The strata have been intensely altered, folded and faulted lending itself to be considered as a highly interesting prospective area for mineralization to occur.

Much of the terrain is composed of granite and related rocks, and of complexes made up of gneisses, migmatites and granitized rocks. The intense deformation resulted in brecciation fracturing and mylonitization of these rocks which are prime areas to prospect for mineral occurrence, and in particular those of the meta-sediments.

The permit faults are mainly on a east-north-east strike and are expressed as shear zones of one to two miles in width with many minor faults and shears present at several angles. Some linear belts were found to emanate radio activity as recorded by a 111B Precision Scintillometer and a W56 Fisher Scintillodyne especially in or near fissures or cracks in the rock.

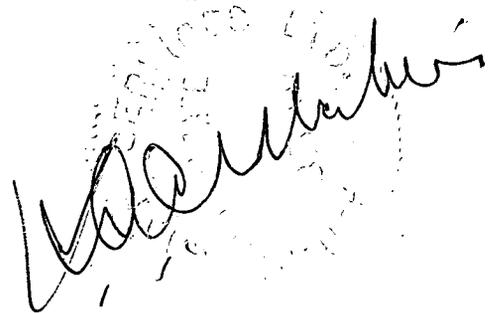

SUMMARY

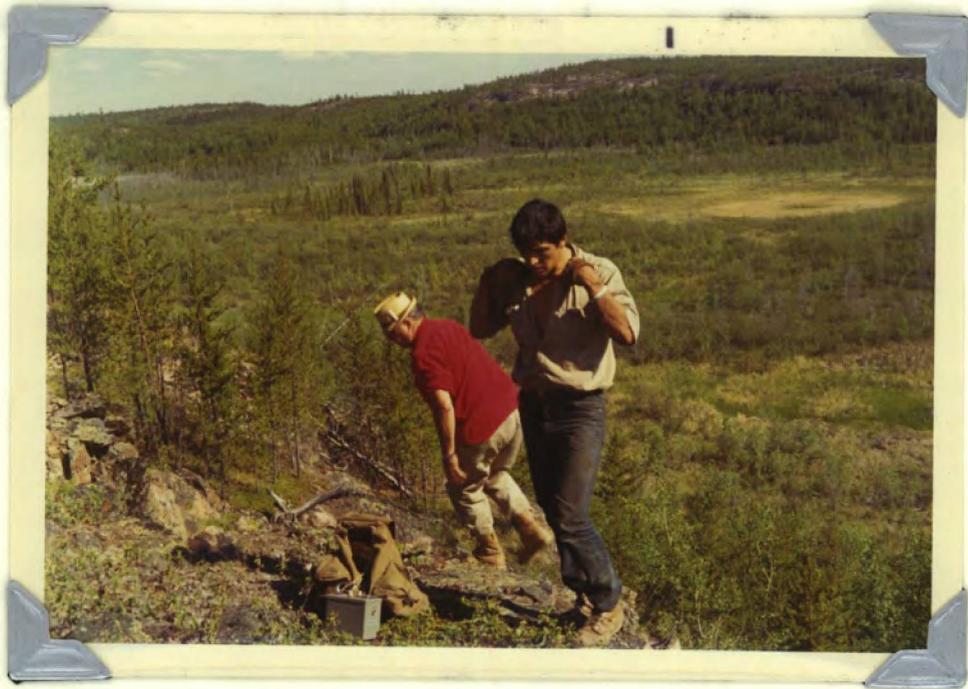

The permit is in an area which forms the Canadian Shield in the province of Alberta. Within this geologic province, numerous occurrences and concentrations of mineral deposits are known. The deposits found in

this general area, mainly vein and related types that often are genetically and spatially related to fault and shear zones. Metalliferous occurrences, were found to be quite numerous, but not very significant, and discussing them individually is beyond the scope of this report.

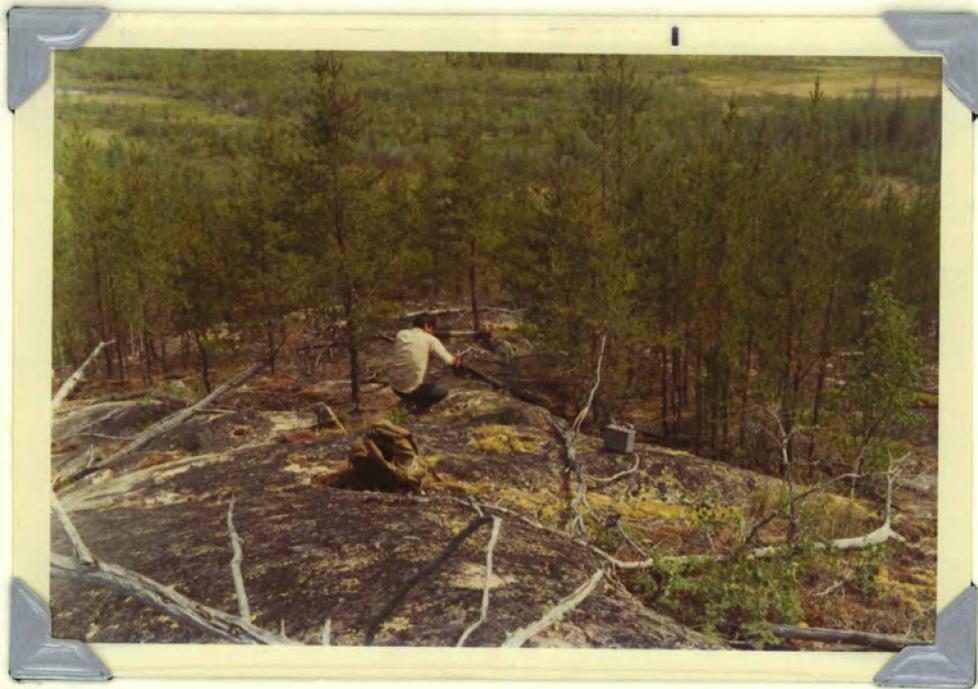

RECOMMENDATIONS

The results of the emission spectograph on all samples does not indicate mineralization of interest and it is therefore suggested that on the basis of this program, that no further expense is justified.

A handwritten signature in cursive script is written over a faint, circular stamp. The stamp contains some illegible text, possibly a date or a reference number, but it is too light to read clearly.
