DISCLAIMER
By accessing and using the Alberta Energy website to download or otherwise obtain a scanned mineral assessment report, you (“User”) agree to be bound by the following terms and conditions:

a) Each scanned mineral assessment report that is downloaded or otherwise obtained from Alberta Energy is provided “AS IS”, with no warranties or representations of any kind whatsoever from Her Majesty the Queen in Right of Alberta, as represented by the Minister of Energy (“Minister”), expressed or implied, including, but not limited to, no warranties or other representations from the Minister, regarding the content, accuracy, reliability, use or results from the use of or the integrity, completeness, quality or legibility of each such scanned mineral assessment report;

b) To the fullest extent permitted by applicable laws, the Minister hereby expressly disclaims, and is released from, liability and responsibility for all warranties and conditions, expressed or implied, in relation to each scanned mineral assessment report shown or displayed on the Alberta Energy website including but not limited to warranties as to the satisfactory quality of or the fitness of the scanned mineral assessment report for a particular purpose and warranties as to the non-infringement or other non-violation of the proprietary rights held by any third party in respect of the scanned mineral assessment report;

c) To the fullest extent permitted by applicable law, the Minister, and the Minister’s employees and agents, exclude and disclaim liability to the User for losses and damages of whatsoever nature and howsoever arising including, without limitation, any direct, indirect, special, consequential, punitive or incidental damages, loss of use, loss of data, loss caused by a virus, loss of income or profit, claims of third parties, even if Alberta Energy have been advised of the possibility of such damages or losses, arising out of or in connection with the use of the Alberta Energy website, including the accessing or downloading of the scanned mineral assessment report and the use for any purpose of the scanned mineral assessment report so downloaded or retrieved.

d) User agrees to indemnify and hold harmless the Minister, and the Minister’s employees and agents against and from any and all third party claims, losses, liabilities, demands, actions or proceedings related to the downloading, distribution, transmissions, storage, redistribution, reproduction or exploitation of each scanned mineral assessment report obtained by the User from Alberta Energy.

Alberta Mineral Assessment Reporting System
INTRODUCTION

Quartz Mineral Exploration Permit 161 lies in the Foothills of southwestern Alberta adjoining northeast of the Clark Range. It comprises 17,920 acres. This report presents the results of a geochemical survey of Permit 161 which was conducted in October 1970.

SUMMARY AND RECOMMENDATIONS

A total of 86 samples of stream, spring, and lake waters in Permit 161 were collected and analyzed for copper, lead, and zinc. No significant anomalous concentrations were obtained in the lead samples. Fourteen anomalous or slightly anomalous concentrations were obtained for zinc and one slightly anomalous concentration was obtained for copper. They show no easily detectible pattern, and are considered to be due to vagaries in the geochemical mobility of zinc, whose source is in the Precambrian rocks to the south and west.

FIELD PROCEDURE

Samples were collected in wide mouth 10 oz. or 16 oz. polyethylene bottles with bakelite caps, lined with cardboard and waterproof paper. Before use, each bottle and cap was thoroughly rinsed with the water to be sampled; then the sample was collected; the bottle tightly closed, numbered, and notes made. The notes consisted of recording the temperature of the water, estimating or measuring the breadth of water surface and maximum depth of the stream. The pH was measured by means of alkacid test paper and found to be between 5 1/2 and 6 in all samples. At the field camp most turbid samples were filtered, and then all samples were acidified with concentrated HCl, about 12N at approximately 5 cc of acid per 300 ml of sample.

LABORATORY PROCEDURE

Samples were shipped to a commercial laboratory for analysis. There 200 ml of sample was evaporated to dryness in carefully cleaned glassware, the residue taken up with 25 ml of HCl and analyzed by standard atomic absorption techniques.
In samples with appreciable concentrations of copper, lead, or zinc, a portion of the sample as received was checked against the concentrated sample. This precaution ensured that any serious contamination of samples occurring in the laboratory was detected, but not contamination during collection or acidification. The detection limits for samples treated as above for copper, lead, and zinc are 2, 9, and 2 ppb respectively, so that zeros in the data mean concentrations below these limits. In spite of this, concentrations as low as 5 ppb for lead have been reported.

RESULTS

The results of the geochemical survey are shown in Figures 1, 2, and 3. Evaluation of the geochemical survey is based on the concentrations below.

<table>
<thead>

</tbody>
</table>

One copper concentration is slightly anomalous, all the other copper concentrations are background. All lead concentrations are background. One zinc concentration is anomalous; 13 are slightly anomalous; and the rest are background. No pattern for the anomalous and slightly anomalous zinc concentrations is readily detectible. They are regarded as illustrating the vagaries of the geochemical mobility of zinc from its source which is not believed to be in the Cretaceous rocks where the anomalous and slightly anomalous concentrations were found in the stream, spring, or lake waters. The geochemical mobility of zinc is apparently much higher than copper or lead.

CONCLUSIONS

The geochemical survey has shown three or four areas in or adjacent to Permit 161 with anomalous or slightly anomalous concentrations of zinc. No significant copper or lead anomalies were found. The zinc anomalies show no
detectible pattern; they are believed to be due to the mobility of zinc being greater than that of copper or lead in moving from its sources which are probably in the Precambrian rocks of the Purcell Series to the south and west.

Based on this survey, this Permit is to be terminated.

Respectfully submitted,

Edmonton, Alberta
