DISCLAIMER
By accessing and using the Alberta Energy website to download or otherwise obtain a scanned mineral assessment report, you (“User”) agree to be bound by the following terms and conditions:

a) Each scanned mineral assessment report that is downloaded or otherwise obtained from Alberta Energy is provided “AS IS”, with no warranties or representations of any kind whatsoever from Her Majesty the Queen in Right of Alberta, as represented by the Minister of Energy (“Minister”), expressed or implied, including, but not limited to, no warranties or other representations from the Minister, regarding the content, accuracy, reliability, use or results from the use of or the integrity, completeness, quality or legibility of each such scanned mineral assessment report;

b) To the fullest extent permitted by applicable laws, the Minister hereby expressly disclaims, and is released from, liability and responsibility for all warranties and conditions, expressed or implied, in relation to each scanned mineral assessment report shown or displayed on the Alberta Energy website including but not limited to warranties as to the satisfactory quality of or the fitness of the scanned mineral assessment report for a particular purpose and warranties as to the non-infringement or other non-violation of the proprietary rights held by any third party in respect of the scanned mineral assessment report;

c) To the fullest extent permitted by applicable law, the Minister, and the Minister’s employees and agents, exclude and disclaim liability to the User for losses and damages of whatsoever nature and howsoever arising including, without limitation, any direct, indirect, special, consequential, punitive or incidental damages, loss of use, loss of data, loss caused by a virus, loss of income or profit, claims of third parties, even if Alberta Energy have been advised of the possibility of such damages or losses, arising out of or in connection with the use of the Alberta Energy website, including the accessing or downloading of the scanned mineral assessment report and the use for any purpose of the scanned mineral assessment report so downloaded or retrieved.

d) User agrees to indemnify and hold harmless the Minister, and the Minister’s employees and agents against and from any and all third party claims, losses, liabilities, demands, actions or proceedings related to the downloading, distribution, transmissions, storage, redistribution, reproduction or exploitation of each scanned mineral assessment report obtained by the User from Alberta Energy.
KINtLA EXPLORATIONS LIMITED

Geological Report # S - P 1 *

1973

Permit Area 176,
Southwestern Alberta.

E. Goble
April 15, 1974.
INTRODUCTION

Prospecting permit area # 176 consists of 9,920 acres, more or less centered upon latitude 49° 13' N and longitude 114° 21' W. The permit area lies adjacent to the British Columbia - Alberta boundary at the headwaters of the West Castle River in the Crowsnest Forest Reserve. It covers exposures of the Grinnell, Siyeh, Purcell Lava, Sheppard, Gateway, and Phillips Formations, and the lower portion of the Roosville Formation, (of the Precambrian Belt Series) in the Akamina Syncline. The permit was taken out by Kintla Explorations Limited in the early spring of 1973, following the return of excellent gold values in syenitic and dioritic intrusives from Kintla's Commerce Mountain property immediately south of the permit area (in B.C.). A prospecting program was undertaken on the permit with a view towards expanding the program to include mapping and drilling the property if results warranted it. This is a summary of that program.

REGIONAL SETTING

Prospecting Permit # 176 is situated within the Clarke Range of the Rocky Mountains some 15 miles north of the Canada - United States border. The permit area is bounded by latitudes 49° 11' N and 49° 16' N and by longitudes 114° 16' W and 114° 24' W, covering a total of 9,920 acres adjacent to the Alberta - British Columbia border.

The permit area is situated in mountainous terrain typical of the Lewis Range of the southern Canadian Rockies. Relief in the area is rugged, with valley bottoms between 5000 and 6000 feet above sea-level, and mountain peaks between 7500 and 9000 feet above sea-level. Access is good via a forestry road along West Castle River to the center of the permit area, but all other portions of the area can be reached
only on foot. Winter access is restricted by annual snowfalls of 80 to 90 inches, but ridge tops and the southern faces of the mountains are generally open all year.

REGIONAL GEOLOGY

The permit area is situated within a region underlain by Precambrian rocks of the Lewis Series. The stratigraphic succession of the area is given in Table 1 (after Price, 1962). The area of the permit is for the most part underlain by quartzites, argillites, and carbonate horizons, with minor intercalated sub-marine lavas. The Grinnell, Siyeh, Purcell Lava, Sheppard, Gateway, Phillips, and Roosville Formations outcrop on the permit areas.

Reesor (1957), Price (1964), and Harrison (1972) postulate that the Lewis Series of sediments, of which these are a part, were deposited in the shallow waters of a deltaic basin and were in part of sub-aerial origin. Smith and Barnes (1966) recognize cyclic deep-shallow water depositional phases in the Montana equivalents of the Lewis Series. One such cycle terminates at the base of the Siyeh Formation. The next cycle begins at the base of the Siyeh Formation with marcasitic shales, continues through the carbonate sequence of the central and upper Siyeh, and terminates after the upper red beds of the Sheppard, Gateway, and Phillips Formations.

The Grinnell, Siyeh, and Sheppard Formations have been intruded by a series of amygdaloidal, porphyritic quartz-diorite sills and dykes up to 80 feet thick in the permit area. These are of Precambrian age and are probably contemporaneous with the extrusion of the Purcell lavas. The Siyeh, Purcell Lava, and Sheppard Formations on the permit area have been intruded by a series of porphyritic -

trachytic syenitic sills and dykes of which the age is still unknown. These intrusions were the main target of the prospecting program.

**PREVIOUS HISTORY OF EXPLORATION**

Copper mineralization in Purcell lavas and diabases of the North Kootenay Pass region in southwestern Alberta was first reported by Dawson in 1886. The region was prospected for gold in the 1870's and 1880's, but no mineralization was found until the oil discovery at Oil City, now in Waterton Lakes National Park, concentrated activity in that area. At that time (1901 - 1903), gold was discovered on the northwestern slope of Buchanan Ridge in Appekunny Formation quartzites. No development was done and when the oil boom collapsed, the claims were dropped. Gold was also discovered in the Appekunny Formation on the east side of Goat Haunt Mountain, now in Glacier National Park, Montana, at approximately this same time and was mined until the death of the owner.

During the first decade of the 20th century, small-scale mining operations were located on copper bearing diabase dykes on Blakiston Brook, Waterton Lakes National Park, and on a gold showing on Chief Mountain in Glacier National Park. Outcrops of cupriferous quartzites and diabase intrusions were found and staked in the Yarrow Creek area at this same time, but these claims were never recorded. In 1963, the first 10 Big Horn claims were staked on these occurrences by Frank and Erik Goble, and by 1966, 75 Big Horn claims and 40 other claims had been recorded in that area.

In 1966, Kennco Exploration (Western) Ltd. optioned the 75 Big Horn claims and during the 1967 field season carried
out an exploration program on them and on the remainder of
the Belt series of southwestern Alberta and southeastern
British Columbia. During this time Kennco located and staked
the Commerce Mountain property, and this ground has been held
continuously until the present when it is owned by Kintla
Explorations Limited.

During the 1972 field season, Kintla located excellent
gold values associated with diabase, diorite, and syenite
intrusions in the Siyeh and Sheppard Formations on the
Commerce Mountain claim block, and picked up contiguous ground
to the north and northeast to the Alberta - British Columbia
border. Prospecting Permit area # 176 is the contiguous
extension of this ground into Alberta.

OUTLINE OF THE 1973 PROSPECTING PROGRAM

In July of 1973 a program of prospecting and sampling
the permit areas was undertaken by Kintla. The immediate
purpose of the program was to determine by means of a modest
field program whether or not there was sufficient mineralization
on the permit to warrant detailed mapping and diamond drilling.
Unfortunately, no showings warranting further work were
located, for although interesting mineralization was located,
it occurred off Permit 176 to the southeast on ground held
by someone else. This was located accidentally during a
traverse from Jutland Mountain to Sage Creek. No traverses
failed to locate mineralization (in the form of chalcopyrite
and malachite), but this is so low in grade that it is
completely uninteresting.

The extension of the "Phillips" bed of copper bearing
siltstone could not be located along the portion of Lys Ridge
covered by the permit, but it must be present on the permit
as it has been located immediately south and north of the
property (in both cases carrying from 0.7 to 1.1 % Cu). Unless this bed can be located exactly, it cannot be examined fully, as any diamond drilling undertaken to test the bed would be wasted without more exact knowledge of the location of the mineralized bed.

RESULTS

Upon receipt of the excellent gold-silver assays from equivalent rocks approximately 1½ miles south of the permit area, it was decided to concentrate the prospecting on the Siyeh and Sheppard Formations, and more specifically, on syenite, diorite, and diabase intrusives within those formations. Later prospecting covered the other formations, and were concentrated on prospecting for copper.

Although intrusives apparently equivalent to those mineralized to the south were located, they were found to carry only traces of gold and silver, with the exception of a small syenite dyke cutting the Purcell Lava on the eastern ridge of Scarpe Mountain. In that location the syenite carried 0.01 oz Au, 0.15 oz Ag, 0.002 % Pb, 0.02 % Zn, and a trace of Cu. This represents approximately $2.00 worth of metals.

Much better showings of up to 0.04 oz Au per ton and up to 0.9 oz Ag per ton were found on traverse 7 along the continental divide southeast of Jutland Mountain. However, these showings are on ground already held under permit, and are not available for additional work.

The second phase of the prospecting program involved examining the Grinnell, Siyeh, and Phillips Formations for copper mineralization. Although every traverse located some mineralization, it was always in the form of chalcopyrite or as chalcopyrite-pyrite assemblage associated with malachite, and was always of very low grade (trace to 0.02 % Cu).
Additional work on these sediments is therefore not justified.

The most attractive target for future work on the area is the "Phillips" bed of copper bearing limey-siltstone. This bed was not located on the permit area but does run through it as it has been located both north and south of the permit area. It apparently crosses the permit area on the heavily wooded western side of Lys Ridge, and no outcrop was found.
A summary of the traverses carried out in 1973 is as follows:

1. Head of West Castle River - 2 men
2. Scarpe Creek to La Coullotte Peak - 2 men
3. Scarpe Creek to Ruby Lake - 4 men
4. Scarpe Creek - 4 men
5. Scarpe Creek to Lys Ridge - 2 men
6. West Castle to Lys Ridge - 2 men
7. Scarpe Creek to Jutland Mountain to Sage Creek - 2 men
8. West Castle to Commerce Creek - 4 men
9. West Castle to La Coullotte Ridge - 4 men
10. West Castle to Scarpe Mountain Peak - 4 men
11. West Castle to Scarpe Mountain (east ridge) - 4 men
12. West Castle to Three Lakes Ridge - 4 men
13. West Castle to Three Lakes Ridge - 4 men
14. Middle Kootenay Pass - 4 men

44 man-days

These traverses are marked and numbered on the enclosed map, and involved personnel at the following rates of pay (26 working days per month):

- Prospector $1000/mo.
- Assistant 600/mo.

$1600/mo.

14 days - $861.53

- Prospector $1000/mo.
- Assistant 550/mo.

$1550/mo.

8 days - $476.92

Geological supervision:
5 days @ $1500/mo. - $288.46

Total
49 man-days - $1626.91
Field Support:

Cook's wages - 14 days @ $700/mo. - $376.92
Food @ $3.50/day, 63 man-days - 220.50
Vehicle Rental -
  One 4-wheel drive @ $474/mo. - 255.76
  One 2-wheel drive @ $375/mo. - 115.38
Total mileage - 1871 mi. @ 10¢ - 187.10
Assaying - 93.00
Field supplies - 35.00

Total - $1283.66

Subtotal - $2910.57
Administration Costs (10%) - 291.05
Total - $3201.62
