DISCLAIMER

By accessing and using the Alberta Energy website to download or otherwise obtain a scanned mineral assessment report, you ("User") agree to be bound by the following terms and conditions:

a) Each scanned mineral assessment report that is downloaded or otherwise obtained from Alberta Energy is provided "AS IS", with no warranties or representations of any kind whatsoever from Her Majesty the Queen in Right of Alberta, as represented by the Minister of Energy ("Minister"), expressed or implied, including, but not limited to, no warranties or other representations from the Minister, regarding the content, accuracy, reliability, use or results from the use of or the integrity, completeness, quality or legibility of each such scanned mineral assessment report;

b) To the fullest extent permitted by applicable laws, the Minister hereby expressly disclaims, and is released from, liability and responsibility for all warranties and conditions, expressed or implied, in relation to each scanned mineral assessment report shown or displayed on the Alberta Energy website including but not limited to warranties as to the satisfactory quality of or the fitness of the scanned mineral assessment report for a particular purpose and warranties as to the non-infringement or other non-violation of the proprietary rights held by any third party in respect of the scanned mineral assessment report;

c) To the fullest extent permitted by applicable law, the Minister, and the Minister’s employees and agents, exclude and disclaim liability to the User for losses and damages of whatsoever nature and howsoever arising including, without limitation, any direct, indirect, special, consequential, punitive or incidental damages, loss of use, loss of data, loss caused by a virus, loss of income or profit, claims of third parties, even if Alberta Energy have been advised of the possibility of such damages or losses, arising out of or in connection with the use of the Alberta Energy website, including the accessing or downloading of the scanned mineral assessment report and the use for any purpose of the scanned mineral assessment report so downloaded or retrieved.

d) User agrees to indemnify and hold harmless the Minister, and the Minister’s employees and agents against and from any and all third party claims, losses, liabilities, demands, actions or proceedings related to the downloading, distribution, transmissions, storage, redistribution, reproduction or exploitation of each scanned mineral assessment report obtained by the User from Alberta Energy.

INTRODUCTION

In June of 1978, Ancon Corporation Ltd. was contracted by Golden Eagle Oil & Gas Limited to conduct a magnetometer survey and V.L.F. Electromagnetic Survey in the Lake Athabasca area in northeastern Alberta.

The observations and conclusions were to be presented in the report on the project.

Approximately 125 miles of Magnetometer and V.L.F. Electromagnetic Survey was completed from June to September on the subject property. Readings were taken every 100 to 150 feet on the cross grid for both V.L.F. Electromagnetic and Magnetometer surveys.

Personnel employed on the project were L.E.W. Hogg; Geologist of Calgary, Alberta, Rick Zozuk of Calgary, Oakley Michelin of Happy Valley, Labrador and Senior Geophysical Operators; R. Sampson of Calgary, D. Wiley of Calgary, J. Sinclair and I. Ripper of Channel Island, B.C., and Scott Rose of Calgary.

A base magnetometer was used for diurnal corrections. The V.L.F. Electromagnetic transmitter station at Seattle, Washington was used for the S.W. transmitter. Cutler Main was used as the AM transmitter station.

Geophysical operations were conducted under Permit #476. Equipment specifications are attached.

### BASE MAGNETOMETER

Geometrics Model G-826A Base Recording magnetometer

### SPECIFICATIONS

- **Resolution:** + 1 gamma throughout tuning range
- **Turning Range:** 20,000 to 90,000 gammas (world-wide)
- **Tuning Mechanism:** Multi-position rotary switch with twenty-four overlapping positions. Peak signal (SIG) amplitude indicator light on readout display.
- **Gradient Tolerance:** Exceeds 800 gammas/foot (Portable applications).
Sampling Rate: Base Station Mode:
Six-position rotary switch for automatic sampling every 4, 10, 30 seconds or 1, 2, or 5 minutes (time base oscillator stable within 10 second/week from 0° to 50°C).

Data Outputs: Visual (Base Station & Portable):
5-digit illuminated incandescent display directly in gammas - visible even in bright sunlight.

Analog (Base Station):
Potentiometric: Calibrated for 100 mV full-scale, maximum load is 20K
Galvanometric: Calibrated for 1 ma full scale into 1500

Digital (Base Station):
5-BCD characters, 1-2-4-8 code (4 line output)
"0" state = 0 to +.5V
"1" state = 2.5 to +5V

Standard Full Scale Resolution:
100 gammas (1 gamma sensitivity)
25 gammas (0.25 gamma sensitivity)

Even Marker: Automatic, every 30 minutes (Analog Recorder only)

CHECK THAT STATION IS TRANSMITTING: Audible signal from speaker.

PARAMETERS MEASURED:

(1) DIP ANGLE in degrees of the magnetic field component, from the horizontal, of the major axis of the polarization ellipse. Detected by a minimum on the field strength meter and read from an inclinometer with a range of ± 90° and an accuracy of ± 1/2 %.

(2) FIELD STRENGTH (total or horizontal) of the magnetic component of the VLF field, (amplitude of the major axis of the polarization ellipse). Measured as a percent of normal field strength established at a base station. Accuracy ± % dependent on signal. Meter has two ranges: 0 - 300% and 0 - 600%.

(3) OUT-OF-PHASE component of the magnetic field, perpendicular in direction to the resultant field, as a percent of normal field strength, (amplitude of the minor axis of the polarization ellipse). This is the minimum reading of the Field Strength meter obtained when measuring the dip angle. Accuracy ± 2%.
OPERATING TEMPERATURE RANGE: \(-30^\circ C (-20^\circ F)\) to \(+50^\circ C (120^\circ F)\)

DIMENSIONS AND WEIGHT: \(9 \times 9 \text{ cm} - 2.7\text{ Kg (6 lb)}\)

SHIPPING: Instrument with foam lined wooden case, shipping wt. \(-6.0\text{ Kg (13 lb)}\)

BATTERIES: 2 of 9 volt - Eveready 216
Average life expectancy - 20 hours for continuous operation
LOCATION AND ACCESS

The property is accessible by float equipped aircraft based at Uranium City, Fort Chipewyan or Fort McMurray. Access by boat from Lake Athabasca is possible during the summer months.

CONCLUSIONS

V.L.F. Electromagnetic Survey

The V.L.F. Electromagnetic survey of Permits 219, 220, 221, 222, and 223 produced no reliable data. The large geologic noise component resulted in unreliable data which is exceedingly difficult to interpret. Interpretation by various data manipulation techniques has not produced usable results.

The geologic noise is primarily a function of the deep and conductive overburden. Overburden consisting of clayey sand beds are estimated to be 75 to 100 feet thick over all of the property. Some of the noise is contributed by the topographic effect of low lying and swampy areas and the adjoining higher areas. The depth to sandstone conductors which is assumed to be in excess of 100 feet will have poorly defined wave forms and will be masked by the conductive overburden.

The V.L.F. data was not plotted.

Magnetometer Survey

The magnetometer survey was performed during a period of very minor diurnal drift. The base magnetometer station was located near the Saskatchewan-Alberta border at Jackfish Creek on Permit 220.
The magnetics generally trend in a northwesterly direction. The magnetic gradient is gentle with a maximum variation of approximately 400 gammas. As the magnetic variation is low and the line spacing is one-quarter of a mile, small features are not definable.

A north-south bias is produced in the contouring as a result of the grid spacing. The very low gradient on Permit 220, 221 and 223 is interpreted as an area of thick Athabasca Sandstone.

No identifiable magnetic features were located over the area diamond drilled in the 1978 program.

The Magnetometer Survey is presented on maps 1 to 7. The location map is attached to this report as Plat #1.

RECOMMENDATIONS

As the magnetic character of the property has been accurately defined, further magnetometer work is not necessary on this property. Further geophysical exploration should utilize deep penetration Electromagnetic techniques.

Seismic surveys could locate geological features for testing by drilling that the magnetometer and V.L.F. surveys failed to do.
